

EXHIBIT 15

IN THE UNITED STATES DISTRICT
COURT FOR THE WESTERN DISTRICT OF
TEXAS WACO DIVISION

WSOU INVESTMENTS, LLC D/B/A
BRAZOS LICENSING AND
DEVELOPMENT,
Plaintiff,

v.

ONEPLUS TECHNOLOGY
(SHENZHEN) CO., LTD.,
Defendant.

§ § Case No. 6:20-cv-00952-ADA
§
§ JURY TRIAL DEMANDED
§
§ § § §
§

PLAINTIFF'S AMENDED FINAL DISCLOSURES OF
PRELIMINARY INFRINGEMENT CONTENTIONS

Pursuant to the Court's Order Governing Proceeding – Patent Case ("Order Governing Proceeding"), Plaintiff WSOU Investments, LLC d/b/a Brazos Licensing and Development ("WSOU") hereby provides its [~~Initial~~ Amended Final] Infringements Contentions to defendant OnePlus Technology (Shenzhen) Co., Ltd. ("OnePlus" or "Defendant") for U.S. Patent No. 8,149,776 (the "'776 Patent").

WSOU makes this disclosure based on the information presently available to it. Discovery in this case has not started, and WSOU reserves its right to amend or supplement these disclosures as permitted by the Federal Rules of Civil Procedure, by the local rules of the Western District of Texas, and by order of the Court, including the Court's Order Governing Proceedings.

For each Asserted Claim, Plaintiff identifies the following Accused Instrumentalities of which it is currently aware. The identification of Accused Instrumentalities is based on Plaintiff's research and analysis to date, without the benefit of discovery from the Defendant.

Plaintiff reserves the right to add, delete, substitute or otherwise amend this list of Accused Instrumentalities based on discovery or other circumstances, in a manner consistent with the Federal Rules of Civil Procedures, local rules, and standing orders.

The Accused Instrumentalities include, without limitation, the following:

- OnePlus mobiles that support 4G (like OnePlus 8, 8 Pro, Nord, 9, 9 Pro).
- All past, current and future OnePlus products and services that operate in the same or substantially similar manner as the specifically identified products and services above and described in Exhibit 1.
- All past, current and future OnePlus products and services that have the same or substantially similar features as the specifically identified products and services above and described in Exhibit 1.

Plaintiff's infringement contentions apply to the Accused Instrumentalities as well as all other past, current and future hardware and software products and services developed, made, used, offered for sale, sold, imported, and provided by OnePlus that contain or makes use of the Patented Technology.¹

Based upon publicly available information, WSOU asserts that OnePlus has infringed and/or continues to infringe the patent and claims identified in the attached claim charts (the "Asserted Claims" of the "Patent-in-Suit"). Infringement claim charts evidencing the correspondence between (i) the elements of the Asserted Claims, and (ii) the corresponding items of the accused products are attached hereto. Further, Exhibit 1, which is attached hereto and incorporated by reference, is an exemplary infringement claim chart identifying specifically

¹ "Patented Technology" means all technologies described in the claims of the Patent-in-Suit.

where each limitation of each Asserted Claim is found within each Accused Instrumentality or practiced by each Accused Instrumentality.

Plaintiff asserts that Defendant has directly infringed and continues to directly infringe the Asserted Claims literally through the Accused Instrumentalities by making, using, offering for sale, and/or selling, or importing into the United States the Accused Instrumentalities. To the extent that Defendant alleges that one or more limitations of the Asserted Claims are not literally

found in the Accused Instrumentalities, Plaintiff alleges that such limitations are found in or practiced by the Accused Instrumentalities under the doctrine of equivalents. Any differences alleged to exist between any of the Asserted Claims and any of the Accused Instrumentalities are insubstantial and that each Accused Instrumentality also meets each limitation under the doctrine of equivalents as the identified features of the Accused Instrumentality performs substantially the same function in substantially the same way to achieve substantially the same result as the corresponding claim limitation. WSOU reserves the right to assert infringement solely under the doctrine of equivalents with respect to any particular claim element(s), if warranted by discovery, further analysis, and/or claim constructions in this case.

Plaintiff further asserts that Defendant has indirectly infringed and continues to indirectly infringe by actively inducing and contributing to infringement of one or more of the claims of the Asserted Patent through the Accused Instrumentalities. Plaintiff also asserts that these third-parties directly infringe at least one or more of the claims of the Asserted Patent through the use of, implementation of, and/or integration with one or more of the Accused Instrumentalities.

For example, Defendant has actively induced infringement by encouraging the use of the Accused Instrumentalities in ways that infringe each Asserted Claim, including, but not limited through providing instructions to its customers and partners to encourage and instruct the user or partner to utilize the accused product in an infringing manner. Defendant knew or should have known that such encouragement would induce infringement. Defendant has taken active steps with the specific intent to encourage and cause others to use each Accused Instrumentality in ways that infringe each Asserted Claim. Such active steps by Defendant with specific intent to induce infringement have included, among other things, advertising, promoting, marketing, making available for use, offering to sell, and/or selling the Accused Instrumentalities

to others;

encouraging and influencing others to import, offer to sell, and/or sell the Accused Instrumentalities; directing and instructing others to use the Accused Instrumentalities in infringing ways; and by providing the Accused Instrumentalities to others. OnePlus has performed the aforementioned active steps with the knowledge of the Asserted Patent at least as of the date when the complaint in this case was filed. OnePlus has known or should have known that the acts it has induced constitute infringement because, for instance, it has been aware that end users and resellers will purchase the Accused Instrumentalities will use them, resulting in direct infringement.

Further, for instance, the Accused Instrumentalities are known by Defendant to be especially made or especially adapted for use to infringe the Asserted Patent, and are not staple articles or commodity of commerce suitable for substantial non-infringing uses. Defendant contributes to the infringement of the Asserted Patent by making available for use, offering for sale, selling, and/or importing the Accused Instrumentalities to third parties, who use the Accused Instrumentalities and/or practice one or more claims of the Asserted Patent. Moreover, Defendant has had notice of the Asserted Patent at least as of the filing of the Complaint in this case.

These Infringement Contentions, including Exhibit 1, are based upon publicly-available information, and Plaintiff's research and analysis to date. The Accused Instrumentalities involve confidential, proprietary designs that are not publicly available, and Defendant has not yet provided discovery. Discovery is ongoing, and Plaintiff anticipates that the subject matter of these infringement contentions will be the subject of expert discovery. Discovery will provide evidence of Defendant's infringement, may lead to the discovery of additional instances of infringement, and may also enable identification of additional claims that are infringed by

Defendant. Plaintiff reserves the right to add, delete, substitute, or otherwise further amend these Infringement

Contentions based on discovery or other circumstances, in a manner consistent with the Federal Rules of Civil Procedures, local rules, and standing orders. Plaintiff explicitly reserves the right to further modify and/or supplement these contentions with additional or different theories and/or additional or different evidence. Further, WSOU reserves the right to supplement or revise its infringement contentions and/or chart, including identification of additional asserted claims, based on, for example, new versions or variations of one or more of the Accused Instrumentalities that are later discovered.

PRIORITY DATE

Each of the Asserted Claims of the '776 Patent is entitled to a priority date of no later than May 12, 2009. The subject matter described by the Asserted Claims, however, may have been conceived and reduced to practice prior to this priority date. WSOU also reserves the right to ~~[identify]~~update its contentions with evidence of an earlier conception and reduction to practice through discovery including identifying any portions of the file history as containing evidence of conception and reduction to practice. Plaintiff's research and analysis is ongoing and Plaintiff reserves the right to assert that the claims are entitled to a priority date that is earlier than the above date.

Dated: ~~[May 18]~~October 26, 2021

Exhibit 1 to
WSOU Investments, LLC's
| **Amended Preliminary Infringement Contentions**

Infringement Claim Chart of U.S. Patent No. 8,149,776 (the “Asserted Patent”)

The Accused Instrumentalities include, without limitation, OnePlus Technology (Shenzhen) Co., Ltd. (“OnePlus” or “Defendant”), OnePlus mobiles that support 4G (like OnePlus 8, 8 Pro, Nord, 9, 9 Pro); all past, current and future OnePlus products and services that operate in the same or substantially similar manner as the specifically identified products and services; and all past, current and future OnePlus products and services that have the same or substantially similar features as the specifically identified products and services.

WSOU Investments, LLC (“WSOU” or “Plaintiff”) contends that OnePlus, including OnePlus’s employees, directly infringes each of the Asserted Claims, either literally or under the doctrine of equivalents. WSOU also contends that OnePlus has indirectly infringed and continues to indirectly infringe by contributing to and actively inducing infringement of one or more of the Asserted Claims.

WSOU does not intend this exemplary claim chart to be limiting, and WSOU reserves its rights to pursue other accused instrumentalities, patent claims, evidence, and infringement arguments in this case.

~~[Fig. 3]~~

[Source: <https://www.qualcomm.com/products/snapdragon-865-5g-mobile-platform>, Page 3, Last Accessed April 01, 2021, Exhibit C]

Qualcomm Snapdragon 865 processor along with X55 RF modem functions on the 3GPP release 15 specifications. In specific, the 3GPP 36.321 is a 4G-based standard that specifies Medium Access Control Protocols and procedures for 4G.

In LTE, each cell supports 64 different preamble sequences with a specific signature pattern (e.g., made using Zadoff-Chu sequences with zero correlation). The UE (i.e., accused product[~~transmits random access preambles comprising a Zadoff-Chu sequence or CAZAC~~]) randomly selects a preamble sequence (i.e., [~~signature sequence~~]) a signature sequence that is randomly selected from [~~one or several root Zadoff-Chu sequences~~] the available preamble sequences (i.e., from a set of [~~signature sequence~~]) signatures) for access (e.g., an initial access). See Fig. 4-Fig. 6. The randomly selected preamble sequence is packed in a random access preamble format (i.e., a first preamble comprising a signature sequence) and transmitted on Physical Random Access Channel (PRACH) as shown in Fig. [4]7.

Citation 4: UE Randomly Selecting an Available Preamble Sequence

When a UE transmit a PRACH Preamble, it transmits with a specific pattern and this specific pattern is called a "Signature". In each LTE cell, total 64 preamble signatures are available and UE select randomly one of these signatures.

--	--

5.7 Physical random access channel

5.7.1 Time and frequency structure

The physical layer random access preamble, illustrated in Figure 5.7.1-1, consists of a cyclic prefix of length T_{CP} and a sequence part of length T_{SEQ} . The parameter values are listed in Table 5.7.1-1 and depend on the frame structure and the random access configuration. Higher layers control the preamble format.

Figure 5.7.1-1: Random access preamble format.

Fig. 7

Source:

https://www.etsi.org/deliver/etsi_ts/136200_136299/136211/08.06.00_60/ts_136211v080600_p.pdf,

Page 37, Last Accessed June 29, 2021, Exhibit D Exhibit D

The target power value is received from the base station to the UE. Based on the preamble_received_target_power, the UE calculates the transmit power followed by transmitting the random access [~~preambles~~]preamble comprising [~~a Zadoff-Chu sequence (i.e.,]~~the signature sequence[~~)]~~]. See Fig. [~~5~~]8.

As an example, the accused product operating in standard LTE UE mode (not in BL UE or UE in enhanced coverage) receives the preamble_received_target_power from eNodeB, and transmits a random access preamble at a calculated transmit power.

	<p style="text-align: center;">Citation [5]8: Transmission of Preambles</p> <p style="text-align: center;">5.1.3 Random Access Preamble transmission</p> <p>The random-access procedure shall be performed as follows:</p> <ul style="list-style-type: none"> - set PREAMBLE_RECEIVED_TARGET_POWER to <i>preambleInitialReceivedTargetPower + DELTA_PREAMBLE + (PREAMBLE_TRANSMISSION_COUNTER - 1) * powerRampingStep</i>; - if the UE is a BL UE or a UE in enhanced coverage: <ul style="list-style-type: none"> - the PREAMBLE_RECEIVED_TARGET_POWER is set to: PREAMBLE_RECEIVED_TARGET_POWER - 10 * $\log_{10}(\text{numRepetitionPerPreambleAttempt})$; <p style="text-align: center;">Fig. [5]8 Source: https://www.etsi.org/deliver/etsi_ts/136300_136399/136321/15.02.00_60/ts_136321v150200p.pdf, Page 24, Last Accessed April 01, 2021, Exhibit E</p>
<p>10b. a processor configured to determine that the access attempt from the first preamble was unsuccessful, and responsive to such determining to cause the transmitter to re-[attempt access to the]</p>	<p>The accused product comprises a processor configured to determine that the access attempt from the first preamble was unsuccessful, and responsive to such determining to cause the transmitter to re-attempt access to the wireless network by causing the transmitter to send on the random-access channel at a second transmit power a second preamble comprising a signature sequence, in which the second transmit power is no greater than the first transmit power.</p> <p>[A UE according to the 3GPP TS 36.321 standard, after transmitting the preamble waits for the random-access response. If this random-access response is not received within a particular time called RA Response Window, the procedure is considered unsuccessful. See Fig. 6.]</p>

Page 25, Last Accessed April 01, 2021, Exhibit E]

On unsuccessful transmission, the UE attempts to retransmit the preamble (i.e., the second preamble comprising a signature sequence) on RACH (i.e., random access channel) with power [~~that is different/same as the first~~](i.e., second transmit power[~~depending upon the power ramping step value. The value of~~]). See Fig. 10.

Citation 10: Transmission Unsuccessful- Preamble Counter

If no Random Access Response is received within the RA Response window, or if none of all received Random Access Responses contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble, the Random Access Response reception is considered not successful and the MAC entity shall:

- if the notification of power ramping suspension has not been received from lower layers:
 - increment PREAMBLE_TRANSMISSION_COUNTER by 1;
- if the UE is an NB-IoT UE, a BL UE or a UE in enhanced coverage:
 - if PREAMBLE_TRANSMISSION_COUNTER = *preambleTransMax*-CE + 1:
 - if the Random Access Preamble is transmitted on the SpCell:
 - indicate a Random Access problem to upper layers;
 - if NB-IoT:
 - consider the Random Access procedure unsuccessfully completed;
- else:
 - if PREAMBLE_TRANSMISSION_COUNTER = *preambleTransMax* + 1:
 - if the Random Access Preamble is transmitted on the SpCell:
 - indicate a Random Access problem to upper layers;
 - if the Random Access Preamble is transmitted on an SCell:
 - consider the Random Access procedure unsuccessfully completed.

Fig. 10

https://www.etsi.org/deliver/etsi_ts/136300_136399/136321/15.02.00_60/ts_136321v150200p.pdf, Page 25, Last Accessed April 01, 2021, Exhibit E

On unsuccessful transmission, the UE attempts to retransmit the preamble on RACH with power that is different/same as the first transmit power depending upon the powerrampingstep value. The value of powerrampingstep can be 0, 2, 4, or 6 dB. When the value of powerrampingstep is 0db (i.e., one of the cases), the first transmit power and second transmit power remains the same (i.e., second transmit power is no greater than the first power). See Fig. [8]11 and Fig. [9]12.

Citation [8]11: Ramping step

Ramping step is broadcast within SIB2 or sent to the UE within an RRC Connection Reconfiguration message. It determines the rate at which the preamble transmit power is increased after receiving no response. The step size can be configured with a value of 0,2,4 or 6 dB.

In specific, the 3GPP 36.321 is a 4G-based standard that specifies Medium Access</p>

	<p>Control Protocols and procedures for 4G.</p> <p>Zadoff-Chu Sequence is sequence of special numbers, which are used in different kind of technologies like Walsh code in CDMA, OVFS code in WCDMA, etc. Zadoff Chu Sequence has some special properties like constant amplitude and zero autocorrelation. See Fig. [14]17.</p> <p style="text-align: center;">[Citation 14: Zadoff-Chu Sequence]</p> <p style="text-align: center;">[Fig. 14]</p>
	<p style="text-align: center;"><u>Citation 17: Zadoff-Chu Sequence</u></p> <p>Zadoff - Chu Sequence</p> <p>As the name implies, this is not a single number. It is a sequence of special numbers. You can find quite a lot of materials on this sequence from internet (try with Wikipedia).</p> <p>Let's first think about how this sequence is generated. Various kinds of number sequences are used in many different kind of technologies (e.g. Walsh code in CDMA, OVFS code in WCDMA) and usually these numbers are created by a special rules or formula. Same to Zadoff-Chu sequence. The basic form of Zadoff chu sequence can be created by the formula as shown in the following spreadsheet (click on the picture to see in magnified view. Please click here if you want to have this spreadsheet).</p> <p>Followings are the special properties of the sequence :</p> <p>i) This sequence has a constant amplitude. If you look into the formula, it is in the form of $e^{-j\theta}$. You may learned about this in high school math. If you convert this into Euler form, you will get $e^{-j\theta} = \cos(\theta) - j \sin(\theta)$. First, you will see this is a complex number which is made up of real and imaginary part. If you plot the numbers onto a complex plan (Real part - horizontal axis and Imaginary part on vertical axis), all the numbers will lie on the perimeter of a circle. This means the amplitude of these number is constant. See the plot above. (Column B, C is one example of Zadoff Sequence. B is the real part and C is imaginary part. The plot is the scatter plot of column B, C)</p> <p>ii) Zero Autocorrelation. If you create a sequence using this formula and create another sequence just by shifting the same sequence by N (N can be 1,2,...,size of sequence -1). And if you take the correlation of the two sequence, the result become 0. Taking the spreadsheet shown above as an example, Column B,C is a sequence created by formula. and Column D,E is not the one created by the formula.. it is just shifted version of Column B, C. Cell F70 and G70 shows the correlation of Column B,C and D,E which gives almost 0. It should be 0 theoretically, but the F70,G70 is not exactly 0 because of numerical errors.. but it is almost 0. If you have two sequence of number and the correlation of the two sequence is 0, we say "the two sequences are orthogonal to each other". It means that you can create many of orthogonal sequences just by shifting a Zadoff Chu sequence. How convenient it is to create orthogonal sequences.. and you know how important to create orthogonal sequences in many wireless communication.</p>

~~[The accused product transmits random access preambles comprising a Zadoff-Chu sequence or CAZAC]~~In LTE, each cell supports 64 different preamble sequences with a specific signature pattern (e.g., made using specific Zadoff-Chu sequences with zero correlation). The network informs the UE about the available preamble sequences (i.e., set of signature sequences) for a particular cell for accessing the network. The UE (i.e., accused product) randomly selects a preamble sequence (i.e., ~~[signature sequence])~~a signature sequence that is randomly selected from ~~[one or several root Zadoff-Chu]~~the available preamble sequences (i.e., from a set of signature sequences) for access (e.g., an initial access). See Fig. 18 - Fig. 20. The randomly selected preamble sequence is packed in a random access preamble format (i.e., a first preamble comprising a signature sequence) and transmitted on Physical Random Access Channel (PRACH) as shown in Fig. ~~[15]~~21.

By way of an example, ~~[the processor comprised with]~~the accused product randomly selects a ~~[Zadoff-Chu sequence or CAZAC]~~preamble sequence (i.e., signature sequence of the first preamble) ~~[randomly selected from one or several root Zadoff-Chu]~~from the available set of preamble sequences in the cell (i.e., ~~[a]~~randomly select from the set of signature ~~[sequence]~~). ~~Additional preamble sequences cannot be generated from the single root Zadoff-Chu sequence, but are obtained from the root—sequences[—with the consecutive logical indexes]]~~. On the unsuccessful attempt of transmitting the first preamble, there is a possibility that the processor again randomly selects a ~~[Zadoff-Chu sequence or CAZAC]~~preamble sequence (i.e., signature sequence of the second

	<p>preamble) from [one or several root Zadoff-Chu sequences (i.e., a set of signature sequence). There is a possibility that the second signature sequence can be selected]<u>the available set of preambles (i.e., separately to randomly select</u> from the [first-]set of signature [sequence or any random set of signature sequence]<u>sequences)</u></p> <p style="text-align: center;"><u>Citation 18: UE Randomly Selecting an Available Preamble Sequence</u></p> <p>When a UE transmit a PRACH Preamble, it transmits with a specific pattern and this specific pattern is called a "Signature". In each LTE cell, total 64 preamble signatures are available and UE select randomly one of these signatures.</p> <p style="text-align: center;"><u>Fig. 18</u></p> <p><u>Source: https://www.sharetechnote.com/html/RACH_LTE.html#Two_types_of_RACH_process, Page 2, Last Accessed June 24, 2021, Exhibit J</u></p>

5.1.3 Random Access Preamble transmission

The random-access procedure shall be performed as follows:

- set PREAMBLE_RECEIVED_TARGET_POWER to $\text{preambleInitialReceivedTargetPower} + \text{DELTA_PREAMBLE} + (\text{PREAMBLE_TRANSMISSION_COUNTER} - 1) * \text{powerRampingStep}$;
- if the UE is a BL UE or a UE in enhanced coverage:
 - the PREAMBLE_RECEIVED_TARGET_POWER is set to:
 $\text{PREAMBLE_RECEIVED_TARGET_POWER} - 10 * \log_{10}(\text{numRepetitionPerPreambleAttempt})$;

Fig. [27]33

Source: https://www.etsi.org/deliver/etsi_ts/136300_136399/136321/15.02.00_60/ts_136321v150200p.pdf, Page 24, Last Accessed April 01, 2021, Exhibit E

For establishing the connection, UE transmits a preamble (i.e., first preamble) on RACH (i.e., random access channel) with power (i.e., first transmit power) that is different/same as the initial transmit power depending upon the powerrampingstep value. The value of powerrampingstep can be 0, 2, 4, or 6 dB. When the value of powerrampingstep is 0db (i.e., one of the cases), the first transmit power and initial transmit power remain the same. On unsuccessful transmission, the UE attempts to retransmit the preamble (i.e., second preamble) with power (i.e., second transmit power) that is different/same as the first transmit power depending upon the powerrampingstep value. The value of powerrampingstep can be 0, 2, 4, or 6 dB. When the value of powerrampingstep is 0db (i.e., one of the cases), the first transmit power and second transmit power remains the same. There may be a case in which initial transmit power is equal to both the first and the second transmit power. See Fig. [28]34 and Fig. [29]35

Citation [28]34: Ramping Step

Ramping step is broadcast within SIB2 or sent to the UE within an RRC Connection Reconfiguration message. It determines the rate at which the preamble transmit power is increased after receiving no response. The step size can be configured with a value of 0,2,4 or 6 dB.

Response Window, the procedure is considered unsuccessful. See Fig. [33]39.

Citation [33]39: Reception of Random-Access Response

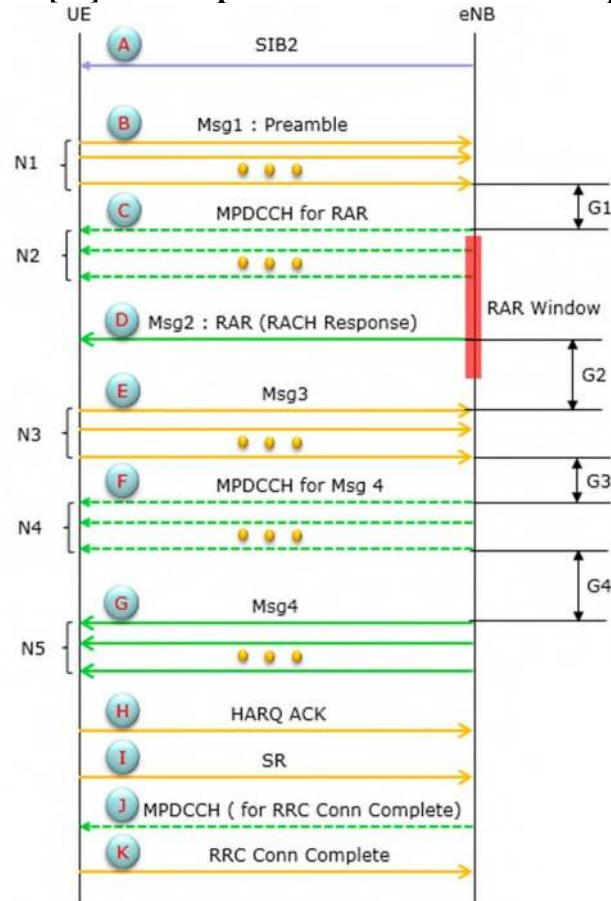

Fig. [33]39

Source: https://www.sharetechnote.com/html/Handbook_LTE_BL_CE_RACH.html, Page 5, Last

Accessed April 01, 2021, Exhibit F

On unsuccessful transmission, the UE attempts to retransmit the preamble (i.e., the third preamble comprising a signature

sequence) on RACH (i.e., random access channel) with power (i.e., third transmit power) that is different/same as the first transmit power depending upon the `powerrampingstep` value. The value of `powerrampingstep` can be 0, 2, 4, or 6 dB. See Fig. [34]40 to Fig. [37]43.

By way of an example, when the value of `powerrampingstep` is 0db while going from the first transmit power to the second transmit power, and the value of `powerrampingstep` is 2db while going from the second transmit power to the third transmit power, then the third transmit power is greater than both the first transmit power and the second transmit power.

Citation [34]40: Transmission Unsuccessful

If no Random Access Response is received within the RA Response window, or if none of all received Random Access Responses contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble, the Random Access Response reception is considered not successful and the MAC entity shall:

- if the notification of power ramping suspension has not been received from lower layers:
 - increment `PREAMBLE_TRANSMISSION_COUNTER` by 1;
- if the UE is an NB-IoT UE, a BL UE or a UE in enhanced coverage:
 - if `PREAMBLE_TRANSMISSION_COUNTER` = *preambleTransMax* - CE + 1:
 - if the Random Access Preamble is transmitted on the SpCell:
 - indicate a Random Access problem to upper layers;
 - if NB-IoT:
 - consider the Random Access procedure unsuccessfully completed;
- else:
 - if `PREAMBLE_TRANSMISSION_COUNTER` = *preambleTransMax* + 1:
 - if the Random Access Preamble is transmitted on the SpCell:
 - indicate a Random Access problem to upper layers;
 - if the Random Access Preamble is transmitted on an SCCell:
 - consider the Random Access procedure unsuccessfully completed.

16c. and wherein the processor is further configured to determine from the parameters the initial power for random access, and wherein the first transmit power is equal to the second transmit	<p>The accused product comprises a processor which is configured to determine from the parameters the initial power for random access, and wherein the first transmit power is equal to the second transmit power which is equal to the initial power.</p> <p>On unsuccessful transmission, the UE attempts to retransmit the preamble (i.e., the second preamble comprising a signature sequence) on RACH (i.e., random access channel) with power (i.e., second transmit power). See Fig. [44]49 and Fig. [45]50.</p>
power which is equal to the initial power.	<p>Citation [44]49: Transmission Unsuccessful</p>

If no Random Access Response is received within the RA Response window, or if none of all received Random Access Responses contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble, the Random Access Response reception is considered not successful and the MAC entity shall:

- if the notification of power ramping suspension has not been received from lower layers:
 - increment PREAMBLE_TRANSMISSION_COUNTER by 1;
- if the UE is an NB-IoT UE, a BL UE or a UE in enhanced coverage:
 - if PREAMBLE_TRANSMISSION_COUNTER = $preambleTransMax - CE + 1$:
 - if the Random Access Preamble is transmitted on the SpCell:
 - indicate a Random Access problem to upper layers;
 - if NB-IoT:
 - consider the Random Access procedure unsuccessfully completed;
 - else:
 - if PREAMBLE_TRANSMISSION_COUNTER = $preambleTransMax + 1$:
 - if the Random Access Preamble is transmitted on the SpCell:
 - indicate a Random Access problem to upper layers;
 - if the Random Access Preamble is transmitted on an SCell:
 - consider the Random Access procedure unsuccessfully completed.

Citation [45]50: Retransmission of Preambles

5.1.3 Random Access Preamble transmission

The random-access procedure shall be performed as follows:

- set PREAMBLE_RECEIVED_TARGET_POWER to $preambleInitialReceivedTargetPower + DELTA_PREAMBLE + (PREAMBLE_TRANSMISSION_COUNTER - 1) * powerRampingStep$;
- if the UE is a BL UE or a UE in enhanced coverage:
 - the PREAMBLE_RECEIVED_TARGET_POWER is set to: $PREAMBLE_RECEIVED_TARGET_POWER - 10 * \log_{10}(numRepetitionPerPreambleAttempt)$;

Fig. [45]50

Source: https://www.etsi.org/deliver/etsi_ts/136300_136399/136321/15.02.00_60/ts_136321v150200p.pdf, Page 24, Last Accessed April 01, 2021, Exhibit E

For establishing the connection, UE transmits a preamble (i.e., first preamble) on RACH (i.e., random access channel) with power (i.e., first transmit power) that is different/same as the initial transmit power depending upon the powerrampingstep value. The value of powerrampingstep can be 0, 2, 4, or 6 dB. When the value of powerrampingstep is 0db (i.e., one of the cases), the first transmit power and initial transmit power remain the same. On unsuccessful transmission, the UE attempts to retransmit the preamble (i.e., second preamble) with power (i.e., second transmit power) that is different/same as the first transmit power depending upon the powerrampingstep value. The value of powerrampingstep can be 0, 2, 4, or 6 dB. When the value of powerrampingstep is 0db (i.e., one of the cases), the first transmit power and second transmit power remains the same. There may be a case in which initial transmit power is equal to both the first and the second transmit power. See Fig. [46]51 and Fig. [47]52.

Citation [46]51: Ramping Step

Ramping step is broadcast within SIB2 or sent to the UE within an RRC Connection Reconfiguration message. It determines the rate at which the preamble transmit power is increased after receiving no response. The step size can be configured with a value of 0,2,4 or 6 dB.
